Large Scale deployment at NHS Ulster Hospital

New delivery of devices and strips ready for large scale deployment at NHS Ulster Hospital.

After the successful trial in Gestational Diabetes the team in Ulster have requested new devices and strips for their continuous care of Gestational Diabetics. The news has been warmly welcomed and part of the ever evolving strategic alliance with the NHS. A blue print has now been developed which can be used as the basis for future deployment within other CCGS's across the UK.

The collaborative partnership between patients and healthcare providers is key to maintaining an effective and efficient health care service, telemetry offers assistance in freeing up valuable time and resource to us used elsewhere, whilst still providing the level of care required to achieve clinical effectiveness and reliability.

“These are exciting times, we providing a telemetry based platform and management program to Gestational diabetics giving both the care provider and patient real time usable results, where if action is required both are in a position to do so, reducing the risk of further complications, costs, discomfort and timely interventions” stated Simon Dempsey, Director of CHS.

The Diabetes team at South Eastern HSC are keen to promote our services to “help meet the ever growing demand on diabetes and pregnancy services due to the increasing number of women being diagnosed with gestational diabetes”.
